

Desktop as a Service: The Sun Desktop System Architecture - Eco friendly and flexible

Presenter: Christian Betz, Sun Microsystems

Thin clients and Desktop Virtualization technologies are giving us the solution to the administrative nightmare of managing multiple versions of Desktops, Laptops, Thin Clients and handheld units. Sun Microsystems have a solution where Thin Clients, various Windows PC's, Linux PC's and hand held units can be disconnected from the application servers in a way that ensures application availability on any platform - also Mac. With this technology users can move between devices and still access the same applications despite the fact that the user may have a Linux device at work and a Mac at home and a Windows Laptop - all that is needed is a Java enabled web browser.
